1.0 Background Introduction

If you want to make the browser trust a HTTPS service (hereinafter referred to as the service), the service must use a certificate that is on the browser's trusted certificate chain. Generally, certificates need to be purchased and bound to a domain name, similar to the following image:

2.0 Configuration method

2.1 Server configuration

First, purchase an https certificate online. It is recommended to purchase an https certificate on Alibaba. After purchasing the certificate, download the type of certificate file. It is recommended to download the nginx type of certificate file. After decompressing the downloaded certificate file, you will get two files with the key and pem suffixes. (This example uses Linux, but the certificate file for Windows is also a compressed file.) As shown in the following figure:

```
-----  
-rw-r--r-- 1 root root 1675 May 28 2019 2275836_linkingvision.cn.key  
-rw-r--r-- 1 root root 4073 May 28 2019 2275836_linkingvision.cn_nginx.zip  
-rw-r--r-- 1 root root 3683 May 28 2019 2275836_linkingvision.cn.pem  
-----
```

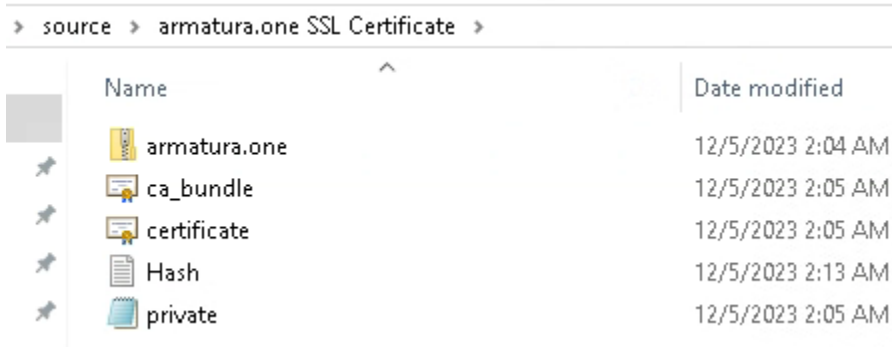

If you are using an nginx type certificate, you can refer to the h5s user manual for the https certificate configuration section.

Use a text compiler (note pad++ is recommended) to first clear the content in server.pem, and copy the PEM file and key file contents of nginx to server.pem one after another. The final file structure can refer to the following figure.

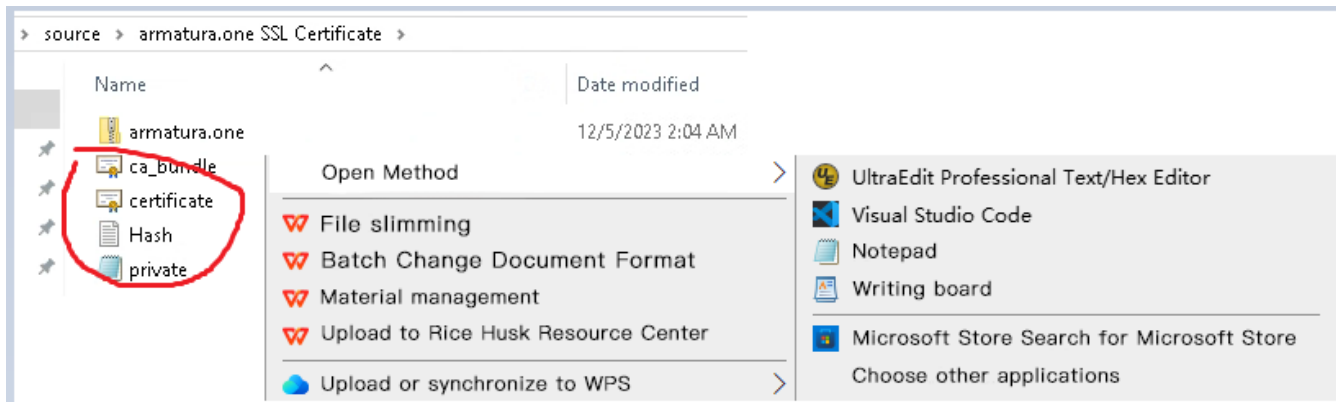

After modifying the server.pem file, restart the H5S service.

```

```

There is another situation where the https certificate is not purchased on Alibaba, but on other platforms or locations. The certificate type after purchase is not nginx, but in other formats. After decompression, there are no files with the pem or key suffixes, as shown in the following image:

Then right-click to edit each file after unzipping (it is recommended to use the notepad++ text compiler, including the following copying operation, also using notepad++). Don't worry about the file icon, just right-click to edit each file and view the contents inside each file.

Until the file content can be matched with the server.pem file field of h5s. Then copy the corresponding file content to the server.pem file of h5s in order (clear the contents of the server.pem file before copying). The file format cannot be messed up when copying, as shown in the following figure:

```
